

mdBook page: Bitcoin Optuna vs SOTA snapshot

ops

2026-05-13

Scope and goal. Add one new page in the mdBook results section that summarizes the current Bitcoin Optuna maxima for Gömb next to existing SOTA-reference rows already tracked in-repo, with explicit protocol caveats.

Affected files. docs/book/src/results/bitcoin-optuna-vs-sota.md, docs/book/src/SUMMARY.md, docs/plans/2026-reports/2026-05-13-book-bitcoin-optuna-sota-page.md.

CORE.YAML items touched. None.

Interface changes. None (documentation-only). No API, CLI, or schema signatures are changed.

Test strategy. (1) Build mdBook to validate navigation and markdown rendering. (2) Confirm the new page is linked from SUMMARY.md. (3) Spot-check cited artifact paths exist in workspace.

Performance budget. Doc build wall time < 120s on current workstation, no long-running jobs, no additional memory-sensitive workloads.

Rollback path. Remove the new markdown page and summary link; remove this plan directory and the corresponding report file.

Risk anticipation. Main risk is protocol conflation (single-trial Optuna maxima vs multi-seed means). Mitigation: state protocol labels inline near every number and add an explicit caution callout. Worst-case production-scale input is not applicable because this is a documentation-only change.
