

Circles counter-example: spectral-entropy shifts the decision boundary inward, pushing more inner points to class 0

Baseline (no reg.), mean of 20 seeds
mean val acc = 0.8859

scalar_entropy ($\lambda=0.1$), mean of 20 seeds
mean val acc = 0.8856 ($\Delta = -0.0003$)

$p_{\text{treat}} - p_{\text{baseline}}$
(dashed = baseline 0.5 contour, solid = treatment)
